

Tax Calculator

Assignment

Build Your Own Tax Calculator — For Your Country, Your Way

AI Pro | Codebasics
Session #2

What This Assignment Is

You just watched a live session where a tax calculator was built using AI — from a PRD to a running app, phase by phase. That was the demonstration. This is your turn.

Your assignment is to build a tax calculator yourself — from scratch, on your own. Not by copying everything from the session. Watch the recording as a reference, understand the flow, and then apply it to build your own version.

💡 The goal is not to replicate what you saw.

The goal is to prove to yourself that you can run this process independently — with your own idea, your own inputs, and your own design decisions.

The Core Task

Where you are in the world changes what you build — but the process is identical for everyone.

IN If you are in India	🌐 If you are outside India
Rebuild the tax calculator from scratch — your way. Do not copy anything from the session recording. Go deeper than what we covered. Add deductions we skipped, make the design better, add features that feel useful to you. Think of the session as a reference — not a template.	Research your country's income tax rules for the current financial year. Build a calculator that works for your tax system — your slabs, your deductions, your exemptions. <i>Examples: USA (federal income tax), UK (PAYE), Canada (T1), Australia (ATO slabs), UAE (no income tax — pick another country).</i>

⚠️ Important: Do not just make it work. Make it useful.

A real person — your friend, your family member, a colleague — should be able to open your app, answer the questions, and walk away knowing exactly what their tax situation looks like.

How to Approach It

Follow the same flow you learned in the session. Every step is here for a reason — do not skip any of them.

A. First Watch the Session

B. Go through the guide: <https://storm-margin-1aa.notion.site/ai-pro-live-session-2>

1	Write Your Idea	Speak or type what you want the app to do. Don't filter yourself. The messier the better. (Adapt it as per your country tax laws)
2	Generate the PRD	Use Claude or Kimi K2.6 to turn your idea into a detailed Product Requirements Document. Save it as a .md file inside your project folder.
3	Set Up Your Folder	Create a project folder. Put the PRD .md file inside it. Open the folder in Antigravity or VS Code.
4	Generate the Plan	Switch to Plan Mode. Ask the AI to read the PRD and create a phase-wise execution plan. No code yet — just the roadmap.
5	Build Phase by Phase	Switch to Agent Mode. Build one phase at a time. After each phase, run npm run dev, open the localhost link, check the app, and approve before moving on.
6	Test It	Click through every screen. Try edge cases. Does the tax math feel right? Are all your inputs working?
7	Redesign (Bonus)	Take a screenshot of your running app. Upload it to ChatGPT Images 2.0. Ask it to generate a polished redesign. Bring that back into Antigravity and implement it.

💡 One phase at a time. Always.

Never ask the AI to build everything at once. Build one phase, run the app, check it works, then move on. This is how professional developers work — and it is what keeps errors small and fixable.

💡 Stuck Somewhere.

Guide: <https://storm-margin-1aa.notion.site/ai-pro-live-session-2>

Ideas to Go Deeper

Once your base app is working, here are some directions you can take it further. These are optional — pick what excites you. You do not need to do all of them.

Feature Idea	What it means	Applies to
Surcharge calculation	Incomes above ₹50 lakh in India attract surcharge (10%–37%). We skipped this entirely. Add it.	India
Freelance / side income	Our app only handles salary. Add a section for freelance income, business income, or consulting fees.	India / Any country
Capital gains	Stocks, mutual funds, property — all taxed differently. Add a capital gains section with STCG and LTCG rates.	India / Any country

PDF export	Let users download their full tax summary as a PDF they can save or share with their CA.	<i>Any country</i>
Multi-year comparison	Show FY 2024-25 vs 2025-26 side by side. Did the new budget help or hurt you?	<i>India</i>
USA federal tax calculator	Build for the US — federal income tax brackets, standard deduction (\$14,600 for 2024), filing status (single vs married).	<i>USA</i>
Full mobile redesign	Make the app look and work beautifully on a phone screen. Responsive layout, thumb-friendly inputs.	<i>Any country</i>
Tax saving suggestions	Based on the user's inputs, suggest specific actions — invest more in 80C, consider NPS, buy health insurance.	<i>India / Any country</i>

🎯 Start small. Really small.

Your first scope will be too ambitious — that is normal. Get the basic version working first. Then extend it. A working simple app beats a broken complex one every time.

Success Criteria

How do you know you are done? Check every item below.

- ✓ You built the app yourself — not copied from the session
- ✓ The app runs in the browser without errors
- ✓ The tax math is correct for your country's rules
- ✓ A non-technical person can use it without getting confused
- ✓ The wizard asks questions in plain language, not finance jargon
- ✓ Results are clear — which option saves more money and by how much
- ✓ You can explain what each input does and why it matters
- ★ **Bonus: the app looks polished after a ChatGPT Images 2.0 redesign**

Show Your Work to the World

You built something real. Do not let it sit on your laptop.

Post it on LinkedIn

Share what you built. A short post, a screen recording, or a screenshot of your app. Talk about:

- What you built and for which country
- The flow you followed — Scope → PRD → Plan → Build in phases → Test
- What surprised you during the build
- One thing you want to add next

Tag these people so we can see it:

Use hashtags: #CBAIPro #Codebasics #AIPROs

Share it on Discord

Drop a screenshot, a short demo video, or a zip of your project in the Codebasics AI Pro Discord. Your community will celebrate it. Other learners will borrow ideas from it. The best discussions in this community come from people sharing what they actually built.

Why This Matters

What sharing does	Why it matters
Forces you to articulate what you built	Makes your learning stick 10x harder
Shows you are someone who actually does the work	Opens doors to conversations, collabs, and opportunities
Inspires others in the community to ship their own	You become the reason someone else starts
Builds your public portfolio over time	Three builds in, this becomes a pattern people notice

The flow you learned is more valuable than any single thing you built with it.

Scope → PRD → Plan → Build in phases → Test → Ship

Apply it to everything. Ship it. Share it.

Happy building.
